NETFLIX AFTER HOURS

USER PERSONAS BLUEPRINT & BEHAVIORAL GROUNDING

Document Version: 1.0
Target: Product & UX Alignment

1. PURPOSE & EMPATHY ANCHOR

Late-night streaming is deeply habit-driven and emotionally rooted. Grounding **Netflix After Hours** in three distinct user personas bridges our high-level strategic goals (bandwidth optimization, tier upgrades) with real human behaviors during late-night hours (11 PM – 3 AM).

Marcus — Habitual Sleeper

AD TIER

29 | Young Professional | TV & Mobile User

Behavior: Plays comfort sitcoms (*The Office*) in bed every night to quiet his mind before sleep.

Key Frictions: Wakes at 3 AM to bright TV glare; loses episode position; interrupted by loud "Are you still watching?" prompts.

Solution Match: 1-Tap 30m Sleep Timer, OLED Display Dimming, Morning Sleep Recovery Card.

Elena — Late-Night Binger

STANDARD TIER

34 | Tech Lead & Parent | Smart TV & iPad

Behavior: Bges serialized dramas (*Stranger Things*) after 11 PM to unwind, frequently falling asleep mid-episode.

Key Frictions: Plot spoilers from auto-playing through season arcs; sudden loud audio cuts startling her awake.

Solution Match: End-of-Episode Anchor, Low-Pass Audio Filter Decay, Deferred Ad Engine.

David — Wearable & Audio Enthusiast

PREMIUM TIER

42 | Health Tech Early Adopter | Apple Watch & Oura Ring User | Mobile & Headphones

Behavior: Listens to true crime documentaries and stand-up specials in bed with a sleep mask or phone screen face down.

Key Frictions: Video streams waste mobile battery overnight; manual timer setup feels archaic compared to his smart ring setup.

Solution Match: Audio-Only Background Streaming, Wearable Auto-Sleep Detection (N1/N2 stage), Spatial Audio Sleep Layer.

2. PERSONA-TO-FEATURE MAPPING & LAUNCH METRICS

Persona	Primary Pain Point	Target After Hours Feature	Impact Metric
Marcus	TV screen glare & lost playback point	1-Tap Timer & Sleep Recovery Card	**+22%** Resume Acc.
Elena	Season spoilers & jarring audio spikes	End-of-Ep Anchor & Audio Filter Decay	**-15%** Season Churn
David	Overnight battery drain & manual setup	Wearable Auto-Detect & Audio Mode	**+8%** Premium Upsell

3. ARCHITECTURE REQUIREMENTS DERIVED FROM PERSONAS

- **Biometric Polling Window (For David):** Wearable sleep state payloads must be processed within a 30-second polling buffer to trigger fading before deep sleep (N2) occurs.
- **Voice Intelligibility Protection (For Elena):** The DSP audio decay algorithm must cut high frequencies (>8kHz) and sub-bass while keeping dialogue legible during volume drop-down.
- **Offline State Resilience (For Marcus):** The decay timestamp must write to local device storage first to guarantee morning recovery card functionality even if home Wi-Fi drops overnight.
